

# Case Study: Patient Scheduling Automation

Built & deployed by Mayank Srivastava | n8n · Google Sheets · Telegram

---

## THE PROBLEM

A doctor received appointment requests over WhatsApp and tracked patients manually. Each morning meant scrolling through messages, cross-checking who was booked for that day, and manually noting names, slots, and phone numbers — a slow, error-prone process that ate into time better spent with patients.

## THE SOLUTION

I designed and deployed an end-to-end automation using n8n:

- Patients book appointments through a simple online form (name, phone, slot, date, payment).
- Every submission is automatically captured and organized in a connected spreadsheet.
- Each morning at 8:30 AM, the system filters that day's appointments, sorts them by time slot, and formats a clean summary.
- The summary is delivered automatically to the doctor via Telegram — no manual checking required.
- The entire system runs 24/7 on a self-managed server with secure HTTPS — not a free tool that sleeps or requires manual restarts.

## THE RESULT

**Zero manual tracking. The doctor now receives an accurate, organized patient list every single morning — automatically, reliably, and with no ongoing effort.**

---

## WHAT I CAN BUILD FOR YOUR BUSINESS

|                               |                                                                       |
|-------------------------------|-----------------------------------------------------------------------|
| <b>Simple Automation</b>      | One trigger, one action — e.g. instant notifications on new data.     |
| <b>Multi-Step Automation</b>  | Data collection → filtering/processing → automated delivery.          |
| <b>Full Automation System</b> | Multiple integrations, AI processing, deployed on a live 24/7 server. |

Have a repetitive manual process? Message me — I'll tell you honestly how it can be automated.
